Hi,
My name is Adish Gupta. During my summer 2026, I built transistors and IC on silicon wafer at AIME in INSA Toulouse as a part of MINATO Summer School 2026 and I loved it. I loved how we utilize the materials' selectivity of reacting with others to build stuff like lego and use them for computing. It was also the first time I saw plasma (argon). I have attached some photos if you would like to view.

Short term: Fabricate devices like diodes, transistors which can then be directly used in our tools for example a photodiode for intensity monitor.

Medium term: Fabricate NMOS Inverter, DRAM, small NMOS logic circuits

Long term: Build an open-source mature PDK that IITB students can easily use to fabricate circuits using the documentation and calibrated tools with published process variations.
